

AIM

To write a C program to search for a given number in an array using the Binary Search method.

ALGORITHM

1. Start
2. Read the number of elements `n` and store them in an array (sorted in ascending order).
3. Read the element to be searched `key`.
4. Initialize `low = 0`, `high = n-1`.
5. Repeat while `low <= high`:
 - Compute `mid = (low + high) / 2`.
 - If `arr[mid] == key`, element is found at position `mid+1`.
 - If `arr[mid] > key`, set `high = mid - 1`.
 - Else, set `low = mid + 1`.
6. If the loop ends and element is not found, print "Element not found".
7. End

CODE:

```
#include <stdio.h>
```

```
int main() {
```

```
    int arr[100], n, key, i;
```

```
    int low, high, mid, found = 0;
```

```
    printf("Enter number of elements (sorted): ");
```

```
    scanf("%d", &n);
```

```
    printf("Enter %d elements in ascending order:\n", n);
```

```
    for (i = 0; i < n; i++) {
```

```
    scanf("%d", &arr[i]);  
}
```

```
printf("Enter the element to search: ");  
scanf("%d", &key);
```

```
low = 0;  
high = n - 1;
```

```
while (low <= high) {  
    mid = (low + high) / 2;
```

```
    if (arr[mid] == key) {  
        printf("Element %d found at position %d.\n", key, mid + 1);  
        found = 1;  
        break;
```

```
    } else if (arr[mid] > key) {  
        high = mid - 1;  
    } else {  
        low = mid + 1;  
    }
```

```
}
```

```
if (!found) {  
    printf("Element %d not found in the array.\n", key);  
}
```

```
printf("\nProgram executed successfully - Binary Search done.\n");
```

```
return 0;  
}
```

INPUT AND OUTPUT

```
Enter number of elements (sorted): 4  
Enter 4 elements in ascending order:  
2  
2  
2  
2  
Enter the element to search: 54  
Element 54 not found in the array.  
  
Program executed successfully - Binary Search done.  
  
=== Code Execution Successful ===
```

RESULT:

The C program to search a number using the Binary Search method was successfully executed and the expected output was obtained.
